Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence for epidermal growth factor receptor (EGFR)
                               Claim 32; Fig 4B; 125pp; English.
                                                                New nucleic acid molecule for use as a marker for screening cancer, comprises the coding region for a T-type calcium channel and regulatory sequences associated with the channel
                                                                                                                                                                                                                                                                           14-SEP-2000; 2000WO-US25479
                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel rapid and highly reproducible method for diagnosis of a cell proliferative disease, comprising analyzing the extent of methylation of cytosine residue in a region participating in the chromosome DNA-related expression of a cytokine receptor gene. The method is used for the diagnosis for psoriasis, chronic rheumatoid arthritis, arteriosclerosis, blood vestely re-nearrowing, diabetic retinopathy, premature neonate retinopathy or solid tumor using body fluids or tissues, particularly blood for genomic DNA extraction. This sequence represents fragment of the human cytokine receptor described in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CpG island is used to study the methylation state of EGFR which maps to chromosome 7p12. The methylation state of specific regions within CpG islands associated with a novel T-type calcium channel CACNAIG gene correlate with several cancerous phenotypes involving various tissue and cell types. Since aberrant methylation of normally unmethylated CpG islands is often observed in immortalised and transformed cells. CACNAIG is implicated in cellular proliferative disorders e.g. leukaemia, colorectal, lung, breast and other cancers. The nucleic acid coding for CACNAIG is useful as a marker for screening cancer and age related diseases. A diagnostic kit containing primers (AAS01574-AAS01623) for amplification of a CpG-containing nucleic acid, where the primer hypridises with a target polynucleotide sequence (AAS01677-AAS01676), can be used for detecting aberrant methylation. The CpG island sequences analysis and containing primers approached the containing primers are contained to the containing primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (AASO1677-AASO1692) are selected from genes encoding CACNAIG, apolipoprotein B (APOB), caudal type homeobox transcription factor 2 (CDX2), epidermal growth factor receptor (EGFR), fibrilin-1 (FBN1), G protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B'; HSPA6), RasGAP-related protein (IGGAP2), klotho (KL), proteinase-activated receptor 2 (PAR2), paired-like homeodomain transcription factor 2 (PITX2), patched A and B (PTCHA; PTCHB) and syndecan 1 and 4 (SDC1; SDC4) or a MINT31 sequence.

TEGFR is derived from human placenta. Fragments of the TEGFR cDNA can be used as a probe in a hybridisation assay to detect full length of TEGFR. An antibody can be produced using the antigen comprising at least the unique C-terminal sequence of the TEGFR polypeptide, optionally conjugated to an immunogenic carrier. The polypeptide, optionally conjugated to an immunogenic carrier. The hybridisation assay and immunoassay to detect the polypeptide. The hybridisation assay and immunoassay can be used in the diagnosis of human cancers. Antibodies and other inhibitors of the TEGFR polypeptide may also be used to treat hyperproliferative diseases including cancer.

The method uses mutated PTKR as a cell surface marker, and is useful for identifying genetically modified cells, especially immunoselection of transduced mammalian cells, and for identifying mammalian cells expressing a protein of interest. The genetically modified marked cells may be used in an autologous or allogeneic setting e.g. gene therapy for bone marrow transplants, graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a human epidermal growth factor receptor 1 (EGFR1). EGFR is a protein-tyrosine kinase receptor (PTKR). The specification describes a method for identifying genetically modified mammalian cells. The method uses a mutated PTKR nucleic acid which comprises a modification to the intracellular and extracellular domains, or comprises a modification to the intracellular domain and excludes a modification to the intracellular domain and excludes the comprises a modification to the intracellular domain and excludes a modification to the intracellular domain and excludes the comprises a modification to the intracellular domain and excludes the comprises a modification to the intracellular domain and excludes the comprise of the comprise 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying genetically modified mammalian cells for use in e.g. bone marrow transplants, comprises use of mutated protein-tyrosine kinase receptor nucleic acid - \,

The method comprises detecting the presence of a nucleic acid encoding an epidermal growth factor receptor (BGFR) mutant protein type II. Deletions in the EGFR gene are found in many gliomas. breast tumours and lung tumours. The method is useful for diagnosing gliomas, breast tumours and lung tumours. The present sequence encodes a normal EGFR polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing glioma in brain cell sample involves determining the presence of a nucleic acid encoding an epidermal growth factor receptor mutant protein type {\tt II} -

This invention describes a novel purified nucleic acid (I) (v-erbB related gene) specifically hybridizing to all or part of a MAC117 gene and not hybridizing to nucleic acid encoding an epidermal growth factor receptor. The product of the invention has anticancer and cytostatic activity. Antibodies to the protein encoded by (I) are conjugated to toxins and kill cancer cells expressing (I). Antibodies to the protein encoded by (I) are useful for the treatment of cancer. Fragments of (I) and the MAC117 gene are useful as probes for the detection of human mammary carcinoma or other malignancies resulting from the v-erbB related gene. This sequence encodes a human epidermal growth factor (EGF)
Epidermal growth factor receptor truncate protein; EGF; binding sites; adsorptive agents; mammalian cell growth abnormality; detection; growth; reproduction; signal transmission; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 5532 BP; 1472 A; 1484 C; 1337 G; 1239 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           γQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of the pRLD3D4 construct which encodes the CC epidermal growth factor (EGF) receptor truncate protein LD3D4 having EGF binding sites. The protein binds ligands of the EGF receptor without transmitting a signal for the growth and reproduction of a cell. It can be used as an adsorptive agent for any moieties that bind the EGF cc receptor as the portal of entry to a cell. It competes with the EGF cc receptor present on the cell surface for the binding of ligands and cc viruses into cells. It can also be used as for prevents the entry of csuch as in the detection of abnormalities in mammalian cell growth. CC It is also useful for prepg. novel receptors for efficient detection of ligands and their anti-agonists or agonists. The features table cindicate a discrepancy between the LD3D4 protein sequence given in the specification and that which the pRLD3D4 DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the pRLD2D3D4 construct which encodes the CC epidermal growth factor (EGF) receptor truncate protein LD2D3D4 construct which encodes the protein get binding sites. The protein binds ligands of the EGF receptor CC without transmitting a signal for the growth and reproduction of a cell. It can be used as an adsorptive agent for any moietles that bind the EGF creceptor as the portal of entry to a cell. It competes with the EGF creceptor present on the cell surface for the binding of ligands and thereby inhibits the action of the ligands or prevents the entry of CC thereby inhibits the action of the ligands or prevents the entry of CC such as in the detection of abnormalities in mammalian cell growth. CC such as in the detection of abnormalities in mammalian cell growth. CC it is also useful for prepg. novel receptors for efficient detection CC iligands and their anti-agonists or agonists. The features table cCC indicates the discrepancies between the LD2D3D4 protein sequence given content in the specification and that which the pRLD2D3D4 DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                      ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc The sequence is that of the pRLDID2D3 construct which encodes the epidermal growth factor (EGF) receptor truncate protein LDID2D3Apal. having EGF binding sites. The protein binds ligands of the EGF receptor without transmitting a signal for the growth and reproduction of a cell. It can be used as an absorptive agent for any moieties that bind the EGF receptor as the portal of entry to a cell. It competes with the EGF cc receptor present on the cell surface for the binding of ligands and cc viruses into cells. It can also be used as for the EGF receptor itself, cc such as in the detection of abnormalities in mammalian cell growth. CC it is also useful for prepg. novel receptors for efficient detection of ligands and their anti-agonists or agonists. The features table indicates the discrepancies between the LDID2D3 protein sequence given in the specification and that which the pRLDID2D3 DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This DNA encodes an epidermal growth factor (EGF) receptor related protein (ERRP). The ERRP is highly homologous to the mouse EGFR and a truncated rat EGFR. The ERRP can be expressed by standard recombinant methodology. The ERRP acts as a EGFR receptor modulator. The ERRP cDN when transfected into colon cancer cell line is useful for inhibiting proliferation of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2001-025007/03.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFs) 8-30. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazoline, thiazoline, bithiazoline and bithiazoline-containing microbial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Shen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New bleomycin gene cluster components useful i polyketide metabolites, especially bleomycin, chemically modifying biological molecules -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
Expression vector for producing heterologous proteins in host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes the XcpV secretion factor of Pseudomonas alcaligenes. The DNA represents a nucleic acid of the invention. The nucleic acids encode: (a) a kinase from a Pseudomonad that regulates the expression of a lipase; (b) a DNA binding regulator from a Pseudomonad that regulates the expression of a lipase; (c) a Pseudomonas alcaligenes upstream activating sequence; (d) a P. alcaligenes sigma 54 promoter that regulates the expression of a lipase; (e) a P. alcaligenes secretion factor selected from XcpP, Q, R, S, T, U, Y, W, X, Y and Z, and OrfV, X, Y; (f) a P. alcaligenes lux-box binding element; and (g) a orfV-box binding element. The nucleic acids represent parts of a regulation cascade, comprising at its heart a kinase and a DNA binding regulator. These sequences can be used for the production of heterologous proteins in a host cell. The cascade also comprises secretion factors which can
                                                                                                                                                                                                                              11-APR-2000
                                                                                                                                                                                                                                                                                                                                           Pseudomonas alcaligenes; expression; lipase regulation cascade; kinase; DNA binding regulator; polymerase; promoter; secretion factor; XcpP; XcpQ; XcpR; XcpS; XcpT; XcpU; XcpV; XcpW; XcpX; XcpX; XcpZ; XcpZ; OrfV; OrfX; OrfX; OrfZ; LipO; LipR; upstream activating sequence;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an expression vector comprising a nucleic acid encoding a kinase and a DNA binding regulator which hybridises under stringent conditions to a nucleic acid isolated from pseudomonas alcaligenes. Also described are: (1) an isolated comprising the above expression vector; (2) a method of transforming a host cell comprising adding the above plasmid to host cells under appropriate conditions; (3) a transformed host cell comprising the above expression vector; and (4) a method for producing a protein comprising the steps of obtaining a host cell comprising the above expression vector; and (4) a method for producing a protein, and culturing the host cell under conditions for the expression vector and further comprising nucleic acid encoding the protein, and culturing the host cell under conditions for the expression of protein. The expression vector of the present invention can be used for producing heterologous proteins in host cells, particularly, lipase in Pseudomonas. Lipases produced can be used in detergents and cleaning formulations in Industrial processes. The invention provides a higher production level and efficiently express a heterologous protein. The present sequence encodes XcpV isolated from Pseudomonas alcaligenes, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A partial cDNA sequence (AAT28293) codes for mouse insulin receptor substrate-2, or IRS-2 (AAR06994), a substrate for the insulin receptor, interleukin-4 receptor and interleukin-15 receptor. The cDNA clone was isolated from a mouse lung cDNA library by screening with clones from other libraries obtd. using probe 60 (see AAT28294-95). The open reading frame shows 51% identity to the IRS-1 sequence. IRS-2 expression was detected in heart, brain, spleen, lung, liver, skeletal muscle, kidney, testis and FDC-P2 cells. The cDNA can be used for prodn. of recombinant IRS-2 or as a probe e.g. transgene can be used to study insulin-related disorders, e.g. type II diabetes. IRS-2 genes may also be used in gene

                                                                                                                                           This sequence encodes the Orfy, Orfy, Orfx, and Xpc secretion factors of pseudomonas alcaligenes. The DNA represents a nucleic acid of the invention. The nucleic acids encode: (a) a kinase from a Pseudomonad that regulates the expression of a lipase; (b) a DNA binding regulator from a pseudomonad that regulates the expression of a lipase; (c) a Pseudomonas alcaligenes upstream activating sequence; (d) a P. alcaligenes signa 54 promoter that regulates the expression of a lipase; (e) a P. alcaligenes secretion factor selected from Xcpp, Q, R, S, T, U, V, W, X, Y and Z, and Orfv, X, Y; (f) a P. alcaligenes liav-box binding element; and (g) a regulation cascade, comprising at its heart a kinase and a DNA binding regulator. These sequences can be used for the production of heterologous proteins in a host cell. The cascade also comprises secretion factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDS

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pTT3 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      differentiated (4 pooled tumors, including primary and

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from pooled lung tumor tissue, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to Eco R1 adaptors (Pharmacia), digested with Not I and Cloned into the Not I and Eco R1 sites of the modified pT7T3 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo. "

The driver was PCR-amplified cDNAs from pools of 5,000 clones made from
(Pharmacia), digested with Not I and cloned into the Not and Eco RI sites of the modified pY773 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo. " 137 c 139 g 117 t 1 others
